Lecture 19 – Closure Properties of Context-Free Languages COSE215: Theory of Computation

Jihyeok Park

2023 Spring

Recall

- A context-free language (CFL) is defined in three different ways:
 - A context free grammar (CFG)
 - A pushdown automaton (PDA) with final states
 - A pushdown automaton (PDA) with empty stacks
- We have learned that the class of regular languages is closed under various operations. (Closure Properties)
- For which operations is the class of CFLs closed?

Closure Properties of CFLs

Definition (Closure Properties)

The class of CFLs is **closed** under an n-ary operator op if and only if $op(L_1, \dots, L_n)$ is context-free for any CFLs L_1, \dots, L_n . We say that such properties are **closure properties** of CFLs.

The class of CFLs is closed under the following operations:

- Union
- Concatenation
- Kleene Star
- Homomorphism
- Reverse

Closure under Union

Theorem (Closure under Union)

If L_1 and L_2 are context-free languages, then so is $L_1 \cup L_2$.

Closure under Union

Theorem (Closure under Union)

If L_1 and L_2 are context-free languages, then so is $L_1 \cup L_2$.

Proof) For given two CFLs L_1 and L_2 , we can always construct two CFGs:

$$G_1 = (V_1, \Sigma, S_1, R_1)$$

 $G_2 = (V_2, \Sigma, S_2, R_2)$

such that $L_1 = L(G_1)$ and $L_2 = L(G_2)$.

Note that the variables of G_1 and G_2 should be disjoint. (i.e., $V_1 \cap V_2 = \emptyset$)

Then, $L_1 \cup L_2$ is accepted by the CFG $G = (V, \Sigma, S, R)$ where:

- $V = V_1 \cup V_2 \cup \{S\}$
- S is a new start variable (i.e., $S \notin V_1 \cup V_2$)
- $R = R_1 \cup R_2 \cup \{S \to S_1, S \to S_2\}$

For example, consider the following two CFLs:

$$L_1 = \{ ab^n \mid n \ge 0 \}$$
 $L_2 = \{ ac^n \mid n \ge 0 \}$

Then, L_1 is accepted by:

$$S_1 o \mathtt{a} X \qquad X o \mathtt{b} X \mid \epsilon$$

and L_2 is accepted by:

$$S_2
ightarrow a X \qquad X
ightarrow c X \mid \epsilon$$

But, the same variable X is used in both grammars.

So, we need to rename it to different variables, such as B and C.

For example, consider the following two CFLs:

$$L_1 = \{ ab^n \mid n \ge 0 \}$$
 $L_2 = \{ ac^n \mid n \ge 0 \}$

Then, L_1 is accepted by:

$$S_1
ightarrow \mathtt{a} B \qquad B
ightarrow \mathtt{b} B \mid \epsilon$$

and L_2 is accepted by:

$$S_2
ightarrow aC$$
 $C
ightarrow cC \mid \epsilon$

For example, consider the following two CFLs:

$$L_1 = \{ ab^n \mid n \ge 0 \}$$
 $L_2 = \{ ac^n \mid n \ge 0 \}$

Then, L_1 is accepted by:

$$S_1
ightarrow aB \qquad B
ightarrow bB \mid \epsilon$$

and L_2 is accepted by:

$$S_2 \rightarrow aC$$
 $C \rightarrow cC \mid \epsilon$

Then, $L_1 \cup L_2$ is accepted by the following CFG:

$$\begin{array}{lll} S & \rightarrow S_1 \mid S_2 \\ S_1 \rightarrow \mathtt{a}B & B \rightarrow \mathtt{b}B \mid \epsilon \\ S_2 \rightarrow \mathtt{a}C & C \rightarrow \mathtt{c}C \mid \epsilon \end{array}$$

Closure under Concatenation

Theorem (Closure under Concatenation)

If L_1 and L_2 are context-free languages, then so is $L_1 \cdot L_2$.

Closure under Concatenation

Theorem (Closure under Concatenation)

If L_1 and L_2 are context-free languages, then so is $L_1 \cdot L_2$.

Proof) For given two CFLs L_1 and L_2 , we can always construct two CFGs:

$$G_1 = (V_1, \Sigma, S_1, R_1)$$

 $G_2 = (V_2, \Sigma, S_2, R_2)$

such that $L_1 = L(G_1)$ and $L_2 = L(G_2)$.

Note that the variables of G_1 and G_2 should be disjoint. (i.e., $V_1 \cap V_2 = \emptyset$) Then, $L_1 \cdot L_2$ is accepted by the CFG $G = (V, \Sigma, S, R)$ where:

- $V = V_1 \cup V_2 \cup \{S\}$
- S is a new start variable (i.e., $S \notin V_1 \cup V_2$)
- $R = R_1 \cup R_2 \cup \{S \to S_1 S_2\}$

For example, consider the following two CFLs:

$$L_1 = \{ ab^n \mid n \ge 0 \}$$
 $L_2 = \{ ac^n \mid n \ge 0 \}$

Then, L_1 is accepted by:

$$S_1
ightarrow aB \qquad B
ightarrow bB \mid \epsilon$$

and L_2 is accepted by:

$$S_2 \rightarrow aC$$
 $C \rightarrow cC \mid \epsilon$

Then, $L_1 \cdot L_2$ is accepted by the following CFG:

$$\begin{array}{lll} S & \rightarrow S_1 S_2 \\ S_1 \rightarrow \mathtt{a} B & B \rightarrow \mathtt{b} B \mid \epsilon \\ S_2 \rightarrow \mathtt{a} C & C \rightarrow \mathtt{c} C \mid \epsilon \end{array}$$

Closure under Kleene Star

Theorem (Closure under Kleene Star)

If L is a context-free language, then so is L^* .

Closure under Kleene Star

Theorem (Closure under Kleene Star)

If L is a context-free language, then so is L^* .

Proof) For a given CFL *L*, we can always construct a CFG:

$$G = (V, \Sigma, S, R)$$

such that L = L(G).

Then, L^* is accepted by the CFG $G' = (V', \Sigma, S', R')$ where:

- $V' = V \cup \{S'\}$
- S' is a new start variable (i.e., $S' \notin V$)
- $R' = R \cup \{S' \rightarrow \epsilon, S' \rightarrow SS'\}$

Closure under Kleene Star – Example

For example, consider the following CFL:

$$L = \{a^n b^n \mid n \ge 0\}$$

Then, L is accepted by:

$$\mathcal{S}
ightarrow \epsilon \mid \mathtt{a} \mathcal{S} \mathtt{b}$$

Then, L^* is accepted by the following CFG:

$$\begin{array}{l} \mathcal{S}' \rightarrow \epsilon \mid \mathcal{S}\mathcal{S}' \\ \mathcal{S} \rightarrow \epsilon \mid \mathbf{a}\mathcal{S}\mathbf{b} \end{array}$$

Theorem (Homomorphism)

Suppose Σ and Γ are two finite sets of symbols. Then, a function $h: \Sigma \to \Gamma^*$ is called a homomorphism. For a given word $w = a_1 a_2 \cdots a_n$,

$$h(w) = h(a_1)h(a_2)\cdots h(a_n)$$

For a language L, $h(L) = \{h(w) \mid w \in L\}$.

Theorem (Homomorphism)

Suppose Σ and Γ are two finite sets of symbols. Then, a function $h: \Sigma \to \Gamma^*$ is called a homomorphism. For a given word $w = a_1 a_2 \cdots a_n$,

$$h(w) = h(a_1)h(a_2)\cdots h(a_n)$$

For a language L, $h(L) = \{h(w) \mid w \in L\}$.

For example, $h: \{0,1\} \to \{a,b\}^*$ be a homomorphism such that:

$$h(0) = ab$$
 $h(1) = a$

Then,

$$h(10) = aab$$
 $h(010) = abaab$ $h(1100) = aaabab$

Theorem (Closure under Homomorphism)

If h is a homomorphism and L is a context-free language, then so is h(L).

Theorem (Closure under Homomorphism)

If h is a homomorphism and L is a context-free language, then so is h(L).

Proof) For a given CFL *L*, we can always construct a CFG:

$$G = (V, \Sigma, S, R)$$

such that L = L(G).

Then, for a given homomorphism $h: \Sigma \to \Gamma^*$, h(L) is accepted by the CFG $G' = (V', \Gamma, S, R')$ where:

- $V' = V \cup \{X_a \mid a \in \Sigma\}$
- $R' = \{Y \to Y'_1 \cdots Y'_n \mid Y \to Y_1 \cdots Y_n \in R\} \cup \{X_a \to h(a) \mid a \in \Sigma\}$ where $\forall 1 \le i \le n$. $Y'_i = \{ \begin{array}{c} Y_i & \text{if } Y_i \in V \\ X_a & \text{if } Y_i = a \in \Sigma \end{array} \}$

Closure under Homomorphism - Example

For example, consider the following CFL:

$$L = \{ww^R \mid w \in \{0,1\}^*\}$$

Then, L is accepted by:

$$S \rightarrow \epsilon \mid 0S0 \mid 1S1$$

If a homomorphism $h: \{0,1\} \to \{a,b\}^*$ is defined as follows:

$$h(0) = ab$$
 $h(1) = a$

Then, h(L) is accepted by the following CFG:

$$egin{aligned} S &
ightarrow \epsilon \mid X_0 S X_0 \mid X_1 S X_1 \ X_0 &
ightarrow ext{ab} \ X_1 &
ightarrow ext{a} \end{aligned}$$

Closure under Reverse

Theorem (Closure under Reverse)

If L is a context-free language, then so is L^R .

Closure under Reverse

Theorem (Closure under Reverse)

If L is a context-free language, then so is L^R .

Proof) For a given CFL L, we can always construct a CFG:

$$G = (V, \Sigma, S, R)$$

such that L = L(G).

Then, L^R is accepted by the CFG $G' = (V, \Sigma, S, R')$ where:

•
$$R' = \{X \to \alpha^R \mid X \to \alpha \in R\}$$

Closure under Reverse – Example

For example, consider the following CFL:

$$L = \{(\mathtt{ab})^n \mathtt{c}^n \mathtt{d}^m \mid n, m \geq 0\}$$

Then, L is accepted by:

$$S o X \mid Sd$$

 $X o \epsilon \mid abXc$

Then, L^R is accepted by the following CFG:

$$S o X \mid dS$$

 $X o \epsilon \mid cX$ ba

Non-Closure Properties of CFLs

Definition (Closure Properties)

The class of CFLs is **closed** under an n-ary operator op if and only if $op(L_1, \dots, L_n)$ is context-free for any CFLs L_1, \dots, L_n . We say that such properties are **closure properties** of CFLs.

The class of CFLs is **NOT** closed under the following operations:

- Intersection
- Complement
- Difference

Non-Closure Properties of CFLs

Definition (Closure Properties)

The class of CFLs is **closed** under an n-ary operator op if and only if $op(L_1, \dots, L_n)$ is context-free for any CFLs L_1, \dots, L_n . We say that such properties are **closure properties** of CFLs.

The class of CFLs is **NOT** closed under the following operations:

- Intersection
- Complement
- Difference

We will prove it by using the fact that the following language is not a CFL:

$$L = \{a^n b^n c^n \mid n \ge 0\}$$

Non-Closure Properties of CFLs

Definition (Closure Properties)

The class of CFLs is **closed** under an n-ary operator op if and only if $op(L_1, \dots, L_n)$ is context-free for any CFLs L_1, \dots, L_n . We say that such properties are **closure properties** of CFLs.

The class of CFLs is **NOT** closed under the following operations:

- Intersection
- Complement
- Difference

We will prove it by using the fact that the following language is not a CFL:

$$L = \{a^n b^n c^n \mid n \ge 0\}$$

We will learn how to prove that L is not a CFL in the next lecture (Pumping Lemma for CFLs).

Non-Closure under Intersection

Theorem (Non-Closure under Intersection)

The class of CFLs is NOT closed under intersection.

Theorem (Non-Closure under Intersection)

The class of CFLs is **NOT** closed under intersection.

Proof) Consider the following two languages:

$$L_1 = \{a^n b^n c^m \mid n, m \ge 0\}$$
 $L_2 = \{a^m b^n c^n \mid n, m \ge 0\}$

Then, L_1 is accepted by:

$$S_1 o X \mid S_1$$
c $X o \epsilon \mid$ a X b

and L_2 is accepted by:

$$S_2
ightarrow Y \mid aS_2 \qquad Y
ightarrow \epsilon \mid bYc$$

Thus, they are both CFLs. However, their intersection is not a CFL:

$$L_1 \cap L_2 = \{a^n b^n c^n \mid n \ge 0\}$$

Definition (Non-Closure under Complement)

The class of CFLs is **NOT** closed under complement.

Definition (Non-Closure under Complement)

The class of CFLs is **NOT** closed under complement.

Proof) Assume that the class of CFLs is closed under complement. Then, for any two CFLs L_1 and L_2 , $L_1 \cap L_2$ is also a CFL:

$$L_1\cap L_2=\overline{\overline{L_1}\cup\overline{L_2}}$$

However, we have already proved that the class of CFLs is not closed under intersection. Thus, the class of CFLs is not closed under complement. \Box

Definition (Non-Closure under Complement)

The class of CFLs is NOT closed under complement.

Proof) Assume that the class of CFLs is closed under complement. Then, for any two CFLs L_1 and L_2 , $L_1 \cap L_2$ is also a CFL:

$$L_1\cap L_2=\overline{\overline{L_1}\cup\overline{L_2}}$$

However, we have already proved that the class of CFLs is not closed under intersection. Thus, the class of CFLs is not closed under complement. \Box

Definition (Non-Closure under Difference)

The class of CFLs is NOT closed under difference.

Definition (Non-Closure under Complement)

The class of CFLs is NOT closed under complement.

Proof) Assume that the class of CFLs is closed under complement. Then, for any two CFLs L_1 and L_2 , $L_1 \cap L_2$ is also a CFL:

$$L_1\cap L_2=\overline{\overline{L_1}\cup\overline{L_2}}$$

However, we have already proved that the class of CFLs is not closed under intersection. Thus, the class of CFLs is not closed under complement. $\hfill\Box$

Definition (Non-Closure under Difference)

The class of CFLs is NOT closed under difference.

Proof) Similarly, we can prove it using the following fact:

$$L_1 \cap L_2 = L_1 \setminus (L_1 \setminus L_2)$$

Closure Properties of CFLs with Regular Languages **PLRG**

Definition (Closure Properties)

The class of CFLs is **closed** under an *n*-ary operator op if and only if $op(L_1, \dots, L_n)$ is context-free for any CFLs L_1, \dots, L_n . We say that such properties are closure properties of CFLs.

The class of CFLs is closed under the following operations with RLs:

- Intersection
- Difference

Closure under Intersection with RLs

Theorem (Closure under Intersection with RLs)

If L_1 Is a CFL and L_2 is a RL, then $L_1 \cap L_2$ is a CFL.

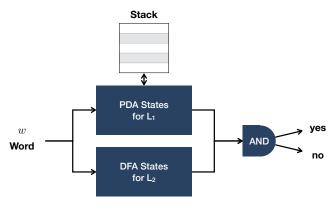

Closure under Intersection with RLs

Theorem (Closure under Intersection with RLs)

If L_1 Is a CFL and L_2 is a RL, then $L_1 \cap L_2$ is a CFL.

There exists a PDA P that accepts L_1 by final states and a DFA D that accepts L_2 . We will construct a PDA P' that accepts $L_1 \cap L_2$ as follows:

Theorem (Closure under Intersection with RLs)

If L_1 Is a CFL and L_2 is a RL, then $L_1 \cap L_2$ is a CFL.

Proof) Consider a PDA $P = (Q_P, \Sigma, \Gamma, \delta_P, q_P, Z, F_P)$ and a DFA $D = (Q_D, \Sigma, \delta_D, q_D, F_D)$ such that:

$$L_F(P) = L_1$$
 $L(D) = L_2$

Then, $L_1 \cap L_2$ is accepted by the PDA $P' = (Q, \Sigma, \Gamma, \delta, q_0, Z, F)$ by final states, where:

- $Q = Q_P \times Q_D$
- $\delta((p,q),\epsilon,X) = \{((p',q),\alpha) \mid (p',\alpha) \in \delta_P(p,\epsilon,X)\}$
- $\delta((p,q),a,X) = \{((p',q'),\alpha) \mid (p',\alpha) \in \delta_P(p,a,X) \land q' = \delta_D(q,a)\}$
- $q_0 = (q_P, q_D)$
- $F = F_P \times F_D$

Closure under Intersection with RLs - Example

For example, consider the following PDA P and DFA D:

$$P = \underbrace{ \begin{array}{c} a \ [Z \to XZ] \\ a \ [X \to XX] \\ b \ [X \to \epsilon] \\ \\ \text{start } [Z] \xrightarrow{p_0} \underbrace{ \begin{array}{c} \epsilon \ [Z \to Z] \\ p_1 \\ \end{array} }_{p_1} \underbrace{ \begin{array}{c} \epsilon \ [Z \to Z] \\ p_2 \\ \end{array} }_{p_2}$$

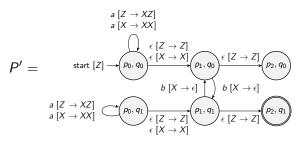

Closure under Intersection with RLs - Example

For example, consider the following PDA P and DFA D:

$$P = \underbrace{ \begin{array}{c} a \left[Z \to XZ \right] \\ a \left[X \to XX \right] & b \left[X \to \epsilon \right] \\ \vdots \\ \text{start } \left[Z \right] \xrightarrow{p_0} \underbrace{ \left[Z \to Z \right] \\ p_1 & \epsilon \left[Z \to Z \right] \\ p_2 & \end{array} }_{\text{start } \left[Z \right] \xrightarrow{p_0} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{b} \\ \text{b} \\ \text{c} & \end{array} \right] }_{\text{start } \left[Z \to Z \right] \xrightarrow{p_1} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start } \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{b} \\ \text{c} & \end{array} \right] }_{\text{start } \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start } \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start } \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start } \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start } \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start } \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start } \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start } \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] }_{\text{start} \left[Z \to Z \right]} \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] \underbrace{ \begin{array}{c} \text{start} \to q_0 \\ \text{c} & \end{array} \right] \underbrace{ \begin{array}{c} \text{start} \to q_0 \\$$

Then, a PDA P' that accepts $L_F(P) \cap L(D)$ by the final states can be constructed as follows:

Closure under Difference with RLs

Theorem (Closure under Difference with RLs)

If L_1 Is a CFL and L_2 is a RL, then $L_1 \setminus L_2$ is a CFL.

Closure under Difference with RLs

Theorem (Closure under Difference with RLs)

If L_1 Is a CFL and L_2 is a RL, then $L_1 \setminus L_2$ is a CFL.

Proof) We know the following fact:

$$L_1\setminus L_2=L_1\cap \overline{L_2}$$

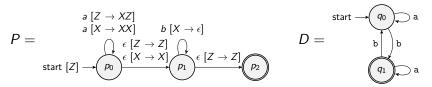

Since the class of RLs is closed under complement, $\overline{L_2}$ is a RL. In addition, we know that the class of CFLs is closed under intersection with RLs.

Thus, $L_1 \setminus L_2$ is a CFL.

Closure under Difference with RLs – Example

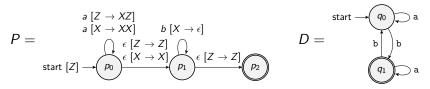

For example, consider the following PDA P and DFA D:

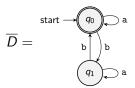

Closure under Difference with RLs - Example

For example, consider the following PDA P and DFA D:

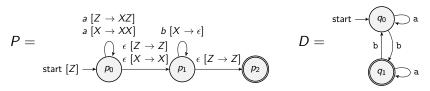

Then, a DFA \overline{D} that accepts $L(\overline{D})$ and a PDA P' that accepts $L_F(P) \setminus L(D) = L_F(P) \cap \overline{L(D)}$ can be constructed as follows:

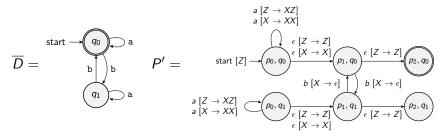

Closure under Difference with RLs - Example

For example, consider the following PDA P and DFA D:

Then, a DFA \overline{D} that accepts $\overline{L(D)}$ and a PDA P' that accepts $L_F(P) \setminus L(D) = L_F(P) \cap \overline{L(D)}$ can be constructed as follows:
