#### Definition of NFA

## Definition (Nondeterministic Finite Automaton (NFA))

A nondeterministic finite automaton is a 5-tuple:

$$N = (Q, \Sigma, \delta, q_0, F)$$

- Q is a finite set of states
- $\Sigma$  is a finite set of **symbols**
- $\delta: Q \times \Sigma \to \mathcal{P}(Q)$  is the transition function
- $q_0 \in Q$  is the initial state
- $F \subseteq Q$  is the set of **final states**

$$N = (\{q_0, q_1, q_2\}, \{0, 1\}, \delta, q_0, \{q_2\})$$

$$\delta(q_0,0) = \{q_0,q_1\} \qquad \delta(q_1,0) = \{q_2\} \qquad \delta(q_2,0) = \emptyset$$

$$\delta(q_0,1)=\{q_0\}$$
  $\delta(q_1,1)=\varnothing$   $\delta(q_2,1)=\varnothing$ 

```
// The type definitions of states and symbols
type State = Int
type Symbol = Char
// The definition of NFA
case class NFA(
  states: Set[State].
  symbols: Set[Symbol],
  trans: Map[(State, Symbol), Set[State]],
  initState: State.
  finalStates: Set[State],
// An example of NFA
val nfa: NFA = NFA(
  states = Set(0, 1, 2),
  symbols = Set('0', '1'),
  trans = Map(
    (0, 0) \rightarrow Set(0, 1), (1, 0) \rightarrow Set(2), (2, 0) \rightarrow Set(3),
    (0, '1') \rightarrow Set(0), (1, '1') \rightarrow Set(), (2, '1') \rightarrow Set(),
  ).
  initState = 0,
  finalStates = Set(2),
```

# Transition Diagram and Transition Table

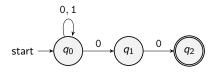

$$N = (\{q_0, q_1, q_2\}, \{0, 1\}, \delta, q_0, \{q_2\})$$

$$egin{aligned} \delta(q_0,0) &= \{q_0,q_1\} & \delta(q_1,0) &= \{q_2\} & \delta(q_2,0) &= arnothing \ \delta(q_0,1) &= \{q_0\} & \delta(q_1,1) &= arnothing \ \delta(q_2,1) &= arnothing \end{aligned}$$

#### Transition Diagram

#### Transition Table

q	0	1
$ ightarrow q_0$	$\{q_0,q_1\}$	$\{q_0\}$
$q_1$	$\{q_2\}$	Ø
* <b>q</b> 2	Ø	Ø

#### Extended Transition Function

#### Definition (Extended Transition Function)

For a given NFA  $N = (Q, \Sigma, \delta, q_0, F)$ , the extended transition function  $\delta^* : Q \times \Sigma^* \to \mathcal{P}(Q)$  is defined as follows:

- (Basis Case)  $\delta^*(q, \epsilon) = \{q\}$
- (Induction Case)  $\delta^*(q, aw) = \bigcup_{q' \in \delta(q, a)} \delta^*(q', w)$

$$\delta^{*}(q_{0}, 100) = \bigcup_{q' \in \delta(q_{0}, 1)} \delta^{*}(q', 00) = \delta^{*}(q_{0}, 00) 
= \bigcup_{q' \in \delta(q_{0}, 0)} \delta^{*}(q', 0) = \delta^{*}(q_{0}, 0) \cup \delta^{*}(q_{1}, 0) 
= \bigcup_{q' \in \delta(q_{0}, 0)} \delta^{*}(q', \epsilon) \cup \bigcup_{q' \in \delta(q_{1}, 0)} \delta^{*}(q', \epsilon) = \delta^{*}(q_{0}, \epsilon) \cup \delta^{*}(q_{1}, \epsilon) \cup \delta^{*}(q_{2}, \epsilon) 
= \{q_{0}, q_{1}, q_{2}\}$$

```
// The type definition of words
type Word = String
// A helper function to extract first symbol and rest of word
object `<|` { def unapply(w: Word) = w.headOption.map((_, w.drop(1))) }</pre>
// The extended transition function of NFA
def extTrans(nfa: NFA)(q: State, w: Word): Set[State] = w match
  case "" => Set(q)
  case a < | x = > for {}
    p <- nfa.trans(q, a)</pre>
    r <- extTrans(nfa)(p, x)
  } yield r
// An example transition for a word "100"
extTrans(nfa)(0, "100") // Set(0, 1, 2)
```

# Acceptance of a Word

## Definition (Acceptance of a Word)

For a given NFA  $N=(Q,\Sigma,\delta,q_0,F)$ , we say that N accepts a word  $w\in\Sigma^*$  if and only if  $\delta^*(q_0,w)\cap F\neq\varnothing$ 

```
// The acceptance of a word by NFA
def accept(nfa: NFA)(w: Word): Boolean =
  val curStates: Set[State] = extTrans(nfa)(nfa.initState, w)
  curStates.intersect(nfa.finalStates).nonEmpty

// An example acceptance of a word "100"
accept(nfa)("100") // true
```

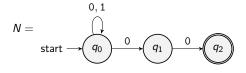

## Language of NFA

## Definition (Language of NFA)

For a given NFA  $N = (Q, \Sigma, \delta, q_0, F)$ , the **language** of N is defined as follows:

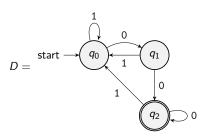

$$L(N) = \{ w \in \Sigma^* \mid N \text{ accepts } w \}$$

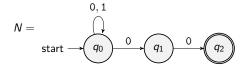

$$L(N) = \{w00 \mid w \in \Sigma^*\}$$

# Equivalence of DFA and NFA

$$\textit{L(D)} = \{\textit{w00} \mid \textit{w} \in \Sigma^*\}$$

# Equivalence of DFA and NFA

## Theorem (Equivalence of DFA and NFA)

A language L is the language L(D) of a DFA D if and only if L is the language L(N) of an NFA N.

Proof) By the following two theorems.

## Theorem (DFA to NFA)

For a given DFA  $D = (Q, \Sigma, \delta, q, F)$ ,  $\exists$  NFA N. L(D) = L(N).

# Theorem (NFA to DFA - Subset Construction)

For a given NFA  $N = (Q, \Sigma, \delta, q_0, F)$ ,  $\exists$  DFA D. L(D) = L(N).

#### Theorem (DFA to NFA)

For a given DFA  $D = (Q, \Sigma, \delta_D, q_0, F)$ ,  $\exists$  NFA N. L(D) = L(N).

#### Proof) Define an NFA

$$N = (Q, \Sigma, \delta_N, q_0, F)$$

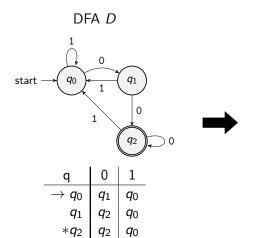

#### where

•  $\forall q \in Q$ .  $\forall a \in \Sigma$ .

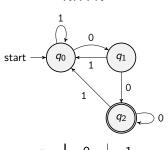

$$\delta_N(q,a) = \{\delta_D(q,a)\}$$

# $\mathsf{DFA} \to \mathsf{NFA} - \mathsf{Example}$

q	U	1
$ ightarrow q_0$	$\{q_1\}$	$\{q_0\}$
$q_1$	$\{q_2\}$	$\{q_0\}$
* <b>q</b> 2	$\{q_2\}$	$\{q_0\}$

#### Lemma

$$\forall q \in Q. \ \forall w \in \Sigma^*. \ \delta_N^*(q, w) = \{\delta_D^*(q, w)\}.$$

Proof) By induction on the length of word.

- (Base Case)  $\delta_N^*(q,\epsilon) = \{q\} = \{\delta_D^*(q,\epsilon)\}.$
- (Inductive Case) Assume it holds for w (I.H.).

$$\begin{array}{lll} \delta_N^*(q,aw) = \bigcup_{q' \in \delta_N(q,a)} \delta_N^*(q',w) & (\because \text{ definition of } \delta_N^*) \\ = \bigcup_{q' \in \{\delta_D(q,a)\}} \delta_N^*(q',w) & (\because \text{ definition of } \delta_N) \\ = \delta_N^*(\delta_D(q,a),w) \\ = \{\delta_D^*(\delta_D(q,a),w)\} & (\because \text{I.H.}) \\ = \{\delta_D^*(q,aw)\} & (\because \text{ definition of } \delta^*) & \Box \end{array}$$

Then, 
$$w \in L(D) \iff \delta_D^*(q_0, w) \in F$$
 (: definition of  $L(D)$ )
$$\iff \{\delta_D^*(q_0, w)\} \cap F \neq \varnothing \quad \text{(: set theory)}$$

$$\iff \delta_N^*(q_0, w) \cap F \neq \varnothing \quad \text{(: above lemma)}$$

$$\iff w \in L(N) \quad \text{(: definition of } L(N)) \quad \Box$$

# DFA ← NFA (Subset Construction)

# Theorem (NFA to DFA – Subset Construction)

For a given NFA  $N = (Q, \Sigma, \delta_N, q_0, F)$ ,  $\exists$  DFA D. L(D) = L(N).

#### Proof) Define a DFA

$$D = (Q_D, \Sigma, \delta_D, \{q_0\}, F_D)$$

#### where

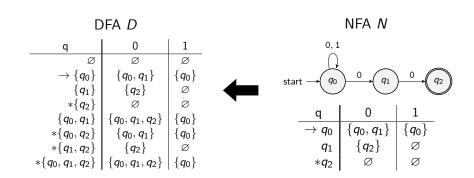

- $Q_D = \mathcal{P}(Q)$
- $\forall S \in Q_D$ .  $\forall a \in \Sigma$ .

$$\delta_D(S,a) = \bigcup_{q \in S} \delta_N(q,a)$$

•  $F_D = \{ S \in Q_D \mid S \cap F \neq \emptyset \}$ 

# DFA ← NFA (Subset Construction) – Example

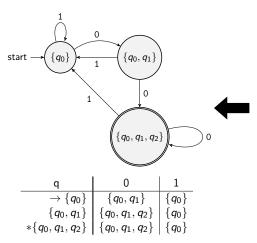

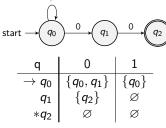

# DFA ← NFA (Subset Construction) – Example

#### Lemma

$$\forall S \in Q_D$$
.  $\forall w \in \Sigma^*$ .  $\delta_D^*(S, w) = \bigcup_{q \in S} \delta_N^*(q, w)$ 

Proof) By induction on the length of word.

- (Base Case)  $\delta_N^*(S, \epsilon) = S = \bigcup_{q \in S} \delta_N^*(q, \epsilon)$ .
- (Inductive Case) Assume it holds for w (I.H.).

$$\begin{array}{ll} \delta_D^*(S,aw) = \delta_D^*(\delta_D(S,a),w) & (\because \text{ definition of } \delta_D^*) \\ = \delta_D^*(\bigcup_{q \in S} \delta_N(q,a),w) & (\because \text{ definition of } \delta_D) \\ = \bigcup_{q \in S} \bigcup_{q' \in \delta_N(q,a)} \delta_N^*(q',w) & (\because \text{I.H.}) \\ = \bigcup_{q \in S} \delta_N^*(q,aw) & (\because \text{ definition of } \delta_N^*) \end{array}$$

Then, 
$$w \in L(D) \iff \delta_D^*(\{q_0\}, w) \in F_D$$
 ( $:$  definition of  $L(D)$ )
$$\iff \delta_D^*(\{q_0\}, w) \cap F_N \neq \varnothing \quad (:$$
 definition of  $F_D$ )
$$\iff \delta_N^*(q_0, w) \cap F \neq \varnothing \quad (:$$
 above lemma)
$$\iff w \in L(N) \quad (:$$
 definition of  $L(N)$ )
